

Docker Toolchain Setup Guide

1. Install the Git Large File Storage package from:
<https://git-lfs.github.com/>
The given tutorial is actually more than you need. All you need is to download the install package and run the *install.sh* script:

```
$wget https:// ... /git-lfs-linux-amd64-x.y.z.tar.gz
$tar xvzf git-lfs-linux-amd64-x.y.z.tar.gz
$cd git-lfs-x.y.z
$sudo ./install.sh
```

2. Clone the Quest/Support repo to get the docker image that contains the toolchain for building Quest:

```
$git-lfs clone https://github.com/QuestOS/Support.git
$cd Support
```

3. Load the docker image:

```
$gunzip pre-built-toolchain.tar.gz
$sudo service docker start
$sudo docker load < ./pre-built-toolchain.tar
```
